

What is CJC 1295/Ipamorelin?

CJC 1295/Ipamorelin is the combination of two compounds, CJC 1295 and Ipamorelin. CJC 1295 is prescribed as a Growth Hormone Releasing Hormone (GHRH) analog that acts on the pituitary. Ipamorelin is prescribed as a selective Growth Hormone Secretagogue that also acts on the pituitary. These two combinations act together to increase Human Growth Hormone by acting on two different families of receptors. It is best prescribed to be taken before bed on an empty stomach. CJC 1295/Ipamorelin is normally prescribed at night to maximize the body's natural cycle of growth hormone and stimulate the pituitary gland during REM sleep.

What forms of CJC 1295/Ipamorelin are available?

CJC 1295/Ipamorelin is available in both reconstituted injectable and oral troche form.

Why would I want to use CJC 1295/Ipamorelin?

CJC 1295/Ipamorelin has been shown to:

- Increase bone density
- Strengthen the cardiovascular system
- Increase muscle mass
- Improve ability to burn fat
- Increase sex drive
- Improve recovery and repair from injuries
- Regenerate nerve tissues
- Strengthen the immune system
- Improve cognition and memory
- Outperforms sermorelin due to longer half-life and increased efficacy

PATIENT BENEFITS

Benefits of CJC 1295/Ipamorelin over the first six weeks may include improvements in:

WEEK 1
QUALITY
OF SLEEP

WEEK 2
RECOVERY FROM
WORKOUTS

WEEK 3
MENTAL
CLARITY

WEEK 4
SKIN
ELASTICITY

WEEK 6
BODY
COMPOSITION

What you need to know:

CJC 1295/Ipamorelin should not be used while pregnant or breastfeeding. Always tell your physician about all medications and supplements, especially corticosteroids and thyroid medications, that you are taking. Common side effects of CJC 1295/Ipamorelin include reactions at the injection site, such as pain, redness or swelling along with flushing of the face; and less than 1 percent of patients report dizziness, headache or hyperactivity.

Why take CJC 1295 and Ipamorelin together?

The combination of CJC 1295 and Ipamorelin has been developed because the two can act together on the pituitary and hypothalamus to increase levels of growth hormone in your body. It is done in this way to maximize the amount of growth hormone being released into your body for therapeutic benefit while acting on two separate families of receptors.
