

What is Scream Cream?

Scream Cream is a topical cream that when applied to the clitoris or external genitalia can have dramatic results. It has been reported that only 25% of women achieve orgasm from sexual intercourse, and even with clitoral stimulation that number only increases to 43%, but when incorporating Scream Cream it can make all the difference.

How does Scream Cream work?

Women have reported substantially increased libido, intensity of orgasm, and also vaginal lubrication. The cream is made of multiple medications (L-Citrulline, Aminophylline, Ergoloid Mesylate, and Pentoxifylline), but the primary mechanism of action is substantial vasodilation to the area of application which increases sensitivity. Topically apply to clitoris and/or external genitalia.

Patient Benefits:

- Non-greasy application
- Little systemic absorption, no drug interactions with other medications
- Fast acting, apply 30 mins prior to sexual contact
- While most commonly utilized by women, it's also safe and effective for men
